

# Cutting Edge Immunotherapy for Peanut Allergy Presented at Biotech Showcase™ 2020

San Francisco, (January 13, 2020) – [Intromme Therapeutics](#) presented an update today on their oral mucosal immunotherapy (OMIT) technology at the Biotech Showcase™, which occurs during the annual J.P. Morgan Healthcare Conference.

“We are very excited to provide investors an overview of our OMIT technology,” said Michael Nelson, CEO, Intromme Therapeutics. “There is no FDA approved treatment currently available for peanut allergy, representing an enormous opportunity to fill this significant unmet need.”

Intromme’s lead product, INT301, is being developed for the treatment of peanut allergies. INT301’s unique formulation is designed to desensitize an individual with peanut allergy using a toothpaste delivery system, protecting them in the event of accidental peanut exposure. More than 3 million people, including an estimated 1.6 million children, have peanut allergy in the U.S. If approved, INT301 has the potential to be the first allergy immunotherapy treatment that easily integrates into a person’s daily routine as both first-line and long-term maintenance therapy for peanut allergy.

OMIT enables consistent delivery of allergy immunotherapy while a user brushes their teeth. Intromme Therapeutics obtained world-wide rights from Allovate Therapeutics to develop the OMIT platform for the treatment of food allergies (including peanut allergy). Over 15 million people in the U.S. and 17 million in Europe suffer from food allergies.

“The use of a patented toothpaste delivery platform is expected to improve allergy immunotherapy by increasing the precision of treatment delivery and promoting treatment adherence,” said Erick Berglund, PhD, Chief Scientific Officer. “OMIT delivers immunotherapy to the oral mucosa, which has the highest likelihood of initiating allergy desensitization. Targeted delivery of medication is

## Quotes

“There is no FDA approved treatment currently available for peanut allergy, representing an enormous opportunity to fill this significant unmet need.

Michael Nelson, JD – CEO

“The use of a patented toothpaste delivery platform is expected to improve allergy immunotherapy by

expected to decrease the rate of side effects linked to swallowing food allergy proteins, including eosinophilic esophagitis, gastrointestinal discomfort and potentially life-threatening anaphylaxis that requires the use of emergency epinephrine.”

## About Oral Mucosal Immunotherapy

Oral mucosal immunotherapy (OMIT) uses a specially formulated toothpaste to stabilize and deliver allergenic proteins to immunologically active areas of the oral cavity with the greatest potential for allergy desensitization. Success with allergy immunotherapy hinges on consistent exposure of a patient’s immune system to gradually “desensitize” the patient to the specific allergy trigger over time. OMIT promises advantages over other approaches to allergy immunotherapy due to its targeted delivery, simplified administration, and support of reliable, long-term adherence.

## About Intromme Therapeutics

Intromme, dedicated to improving and protecting the lives of people with food allergy, is developing the revolutionary oral mucosal immunotherapy (OMIT) treatment platform for food allergies. OMIT is a long-term, patient-friendly immunotherapy for the 220 million people, including more than 9 million adults and 6 million children in the U.S., who suffer from life-altering food allergies. Intromme’s lead product, INT301, is expected to be a safe, effective and convenient therapy for patients who suffer from peanut allergy.
